

Jaden Isaac

Bangalore, India | jadenisaac10@gmail.com | jadenisaac.com | github.com/jadenisaac2005 | linkedin.com/in/jaden-isaac

Education

Amity University Bangalore (Amity School of Engineering and Technology)
B.Tech, Artificial Intelligence & Machine Learning | CGPA: 7.83/10

Expected July 2028

Projects

C++ Neural Network to WebAssembly | *C++, WebAssembly, Emscripten, JavaScript*

github.com/jadenisaac2005/cpp-neural-network

- Reached 97.43% on the 10,000-image MNIST test set (native C++) and 97.33% through the live demo's own preprocessing and WebAssembly code, with backpropagation and dense layers written from scratch
- Shrank weights from 1.16 MB text to 398 KB Float32 binary with identical predictions on all 10,000 test images
- Fixed a silent failure where the demo ran an untrained network: the loader now verifies all 101,770 parameters loaded and disables prediction otherwise

Fake News Classifier | *Python, scikit-learn, pandas, NLTK, NLP*

github.com/jadenisaac2005/news-headline-classifier

- Achieved 95.22% test accuracy on deduplicated WELFake articles (80/20 split, seed 42) with TF-IDF and logistic regression, vs 88.91% title-only and 86.27% Naive Bayes baselines
- Found 2,656 test articles (18.4%) with an identical copy in training (leaky-split accuracy 95.76%); deduplicating removed 8,577 surplus copies (72,134 to 63,557 articles)
- Showed the model's top-weighted features are mostly outlet style (bylines, naming conventions), not claim content; removing 38 such source/format tokens cut accuracy only to 93.54%

NumPy Neural Network from Scratch | *Python, NumPy*

github.com/jadenisaac2005/nn-from-scratch

- Implemented SGD, Momentum and Adam by hand in NumPy (no autograd) and compared them on MNIST: 26, 4 and 2 epochs to reach 97% test accuracy; final 97.90%, 98.07%, 97.91% (100 epochs, one seeded run each)
- Diagnosed from the training curves that momentum had been implemented in EMA form (behaving like SGD); fixed it to classical momentum and added a unit test that fails on the old code

Rockfall Prediction System | *Python, XGBoost, scikit-learn, FastAPI, React, Twilio*

github.com/jadenisaac2005/rockfall-prediction

- Served a SMOTE + StandardScaler + XGBoost risk classifier through FastAPI with three risk levels and Twilio SMS alerts at the critical level, built solo for Smart India Hackathon 2024
- Measured the served model at its real alert cutoff: SMS alerts are 98.3% precise against a 64.75% base rate but catch only 17.4% of events (ROC-AUC 0.75, held-out 60/20/20 split, synthetic data)
- Caught and fixed threshold tuning on the test set and a mismatch between the evaluated and served model

Skills

Languages: Python, C++, TypeScript, JavaScript

ML & Data: NumPy, scikit-learn, XGBoost, pandas, NLTK, NLP

Systems & Web: WebAssembly, Emscripten, FastAPI, React, Next.js, Tailwind CSS

Tools: Git, Vercel
